AppleWorks 1.3 & 2.0: Won't Correctly Skip Pages When Printing

===

This article last reviewed: 3 December 1987

In AppleWorks' word processor, there are occasional printing problems when
there is a page break in the middle of an indented paragraph. If you use the
options menu (Open-Apple-O) to specify a paragraph indent of more than nine
characters, AppleWorks may fail to skip to a new page when it should.

Two workarounds:

- For paragraph indents greater than nine characters, insert nine spaces
  instead of using the Indent command in the Options menu.

- Insert a carriage return on the line before the desired page break,
  creating two paragraphs, one before and one after the page break. (Indent
  the first line of the new second paragraph so it will line up with the
  rest of the text.
