Apple 300/1200 Baud Modem: No Eight-Bit Command

=====

This article last reviewed: 23 September 1987

The Apple 300/1200 baud modem supports data formats up to 8 bits. There is no command to change the data handling of the modem from 7 bits to 8 bits. When data is sent to the modem, as a series of level transitions, the modem simply converts those transitions to frequency shifts. It does not care what the data structure is, up to the specified limits, and will echo whatever is sent to it.
