AppleWorks: "Some cells lost in row...." error

===

Apple Works allocates a fixed amount of RAM space on a row-by-row basis for each row, allowing you to fill any given row with single digit values or small formulae. AppleWorks may not, however, allow you to fill the entire row with these small amounts of data because of the limited amount of RAM. Also, as a result of the limited RAM, the larger the amount of data for each cell, the fewer available cells per row. AppleWorks has an easier time with lots of large values and complex formulae stored vertically.

The overall size of the entire spreadsheet, then, isn't the problem--the layout is. Avoid the problem by planning your spreadsheet in a more columnar fashion, making it tall, not wide.
