Apple EtherTalk Card: Supports TCP/IP With NCSA Telnet

==

This article last reviewed: 7 January 1988

The National Center for Supercomputer Applications offers NCSA Telnet
Version 2.1e, a communications program that supports TCP/IP with the Apple
EtherTalk card.

Telnet Version 2.1e includes file transfer and Tektronix terminal emulation.
Because network access is via NuBus, and is not bottlenecked by the AppleTalk
port, performance is better than with FastPath.

Although Telnet Version 2.1e is in public domain, there is a charge for
handling and diskettes. (Specify the Macintosh version.)

For more information, search under: National Center for Supercomputer
Applications.
