Macintosh Internal Drive

=====

Article Created: 17 January 1986
Article Last Reviewed: 17 July 1992
Article Last Updated: 17 July 1992

PROBLEM DESCRIPTION: The Macintosh Internal Drive will not operate even though a new exchange module has been connected.

CAUSE: The drive is not secured to the chassis.

CURE: Always make sure that the drive is screwed securely to the chassis when troubleshooting for internal drive problems.

Follow General Troubleshooting Procedures if the drive is screwed to the chassis and still does not work.
