Macintosh II and Macintosh IIx: Guided Tour Disks (1/95)

==

Article Created: 10 August 1987
Article Reviewed/Updated: 2 February 1995

TOPIC ---

The following is an explanation why the Mac II Guided Tour disk will not launch
in some situations.

DISCUSSION --

On a 1 megabyte Macintosh II, the Guided Tour disk will not launch if the
Monitors control panel setting has been changed to:

   1. Colors
   2. 16 shades/levels
   3. or both

The additional RAM required by Color QuickDraw for data manipulation causes the
memory available for the Guided Tour to decrease below the required 960K. The
shipping default settings are Black & White and 2 colors.

On a Macintosh II with 2MB of RAM, even with the RAM Cache set to 1536K and
Monitor control panel set to 256 Colors, the Guided Tour always boots. RAM Cache
settings are ignored by the Guided Tour system file.
