Macintosh SE: Don't Start Up From Bernoulli Drive

=====

This article last reviewed: 31 August 1987

If you are using a Macintosh SE with two internal floppy drives and an IOmega Bernoulli drive, be sure to start up the computer with an 800K System disk in one of the drives. If you don't, the computer will try to start up from the Bernoulli drive, and will crash.

In the case of a Macintosh SE with built-in hard disk drive, the computer will always start up from the built-in hard drive.
