Macintosh SE: HD-20SC Setup and Parameter RAM

===

This article last reviewed: 31 August 1987

When you update the SCSI driver on a Macintosh SE, using HD20SC Setup 1.4,
the parameter RAM is affected in three ways:

1. It validates the SCSI ID for the internal drive. If it is determined not
   to be a "reasonable" number, it is set to zero.

2. The time to wait for the internal drive to start up is checked and set, if
   necessary.

3. There is a byte that is sometimes overwritten if the system crashes. If
   this happens, the Macintosh won't start up from the SCSI drive. This byte
   is reset if necessary.
