Macintosh To CDC Cyber Connectivity

=====

This article last reviewed: 25 August 1988

The only package currently known to Apple that provides connectivity from Macintoshes to CDC's (Control Data Corporation's) Cyber mainframe computers is called "CONNECT", and is available from CDC.

CONNECT provides terminal emulation and file transfers under protocol protection for the Macintosh. Terminal emulation supports both line mode and screen mode processing, and is augmented with features such as customized key definitions, use of color, national character set support, menus, configuration control, etc.
