AppleShare PC DA Cannot Be Loaded Into Expanded Memory

===

This article last reviewed: 10 January 1989

The AppleShare PC Desk Accessory cannot be installed into expanded memory.
However, if you have expanded memory, and if the Desk Accessory is
memory-resident, the window buffers make use of expanded memory.

If you are operating in text mode, then the approximately 2K large window
buffer might be placed into that expanded memory space. If you are in
graphics mode, it might be as large as 16K.

If memory is at a premium, you may not want to make the program
memory-resident. You can then use the Desk Accessory by running the program
at the DOS prompt.

NOTE: AppleShare PC 1.2 will not run under DOS 4.0 or 4.0.1; however, the
driver WILL work, enabling you to continue to use the printer services.)
