Macintosh: Sperry Emulation

=====

This article last reviewed: 5 April 1989

Approximately 80 percent of communications with Sperry systems is accomplished via 3270 protocols. Available third-party solutions are Avatar's MacMainFrame and DCA's MacIrma product. The other 20 percent uses Sperry's UniScope, a modified 3270 protocol. To access these systems, connect through a protocol converter using a VT100 terminal emulator.

For more details, search the Tech Info Library under "Avatar", "DCA", and "Sperry".
