AppleFax Modem: Serial NB Card Doesn't Support Multiple Modems

===

This article last reviewed: 7 September 1989

TOPIC --

I who would like to use six AppleFax Modems on a single Macintosh with a Serial
NB Card.

1. Is this possible (that is, are there drivers available for this card)?

2. Is there any software that supports this situation?

DISCUSSION --

We are not aware of any drivers that support the Serial NB Card for the
AppleFax modem. Also, since the modem is treated as an output or Chooser-style
device, only one can be supported for output purposes. In terms of receiving
input, the software also works with only one modem. We do not know of any
third-party software that supports multiple modems.
