AppleShare Print Server: Error Code -127 Problem Solved

=====
This article last reviewed: 20 September 1989

TOPIC-----

I am having trouble in my lab. It contains the following:

Server hardware: Macintosh SE
File server: AppleShare File Server
Print server: AppleShare Print Server
Workstations: Macintosh SE

All the workstations are running System Software 6.0. A fatal error occurred so the print server tried to clean up before releasing the printer. I got Error Code -127

The workstation (the fourth one that was about to print) got the message:

Printing cancelled. A problem occurred while printing. Error -4100

What can I do?

DISCUSSION-----

We tested a similar configuration in two labs. The first runs System 6.0 and the second lab System 6.0.2. We have no problems in the second lab. When we exchanged some equipment between the labs, the first lab still had problems. Running System 6.0.2 in the first lab resolved the printer errors.
