nFLU Virus: Information

=====

This article last reviewed: 3 October 1989

TOPIC -----

Do you have any information concerning what to do about "nFLU", a new virus I have heard about?

DISCUSSION -----

The nFLU virus is another clone of the nVIR B virus. (The "Hpat" virus is another example of an nVIR clone.)

There is a shareware program called "Disinfectant 1.2" available on most networks that removes this and all other known viruses from an infected system. Disinfectant 1.2 also contains a good description of all known viruses.
