TokenTalk NB Card: Range of "Burned In" Addresses

==

This article last reviewed: 2 November 1989

TOPIC --

I have two questions about the TokenTalk NB Card:

1) What is Apple's range of "burned in" addresses for the TokenTalk NB
   Card? I have a customer who has the IBM LAN Manager software and wants
   to identify the newly installed Macintosh systems by their addresses.

2) In the LAN Minds binders, there was mention of a CDEV that comes with
   MacAPPC and MacDFT that allows the identification and changing of the
   addresses associated with the TokenTalk NB Card. Can I have some more
   information?

DISCUSSION ---

1) The IEEE 802 committee has assigned Apple the address range of
   "5000E0000000" to "5000EFFFFFFF". This gives Apple over 268 million
   possible Token Ring network node addresses.

2) The CDEV in question is called "Token Ring" and will be included with
   MacAPPC but not with MacDFT. The MacDFT CDEV has all the functions of
   the Token Ring CDEV plus the MacDFT specific features.
