Multiple Sessions Possible On VAX Systems

===

This article last reviewed: 18 January 1990

TOPIC --

I'm using the White Pine Mac241 product as a terminal emulator for my two VAX
systems, and I want to do multiple sessions on the VAX systems -- a session on
each at the same time over LocalTalk. Does the LAT protocol needs to be
supported to do this?

I think multiple VAX sessions are possible, but I do not know if the White
Pines product supports it. Can you help?

DISCUSSION --

Digital's Local Area Transport (LAT) architecture is a set of protocols used by
terminal servers to communicate with host computer systems over a
high-bandwidth, high-reliability communications channel.

Multiple VAX sessions are currently supported by White Pine Mac240 and Mac241
using Digital's CTERM Network Protocols implemented in Alisa TSSnet. Any
terminal emulators using the WPIO interface (as defined by White Pine Software)
are supported. Contact Alisa for more particular information on the interface.

For more information, search under: "Alisa Systems" and "White Pine"
