LocalTalk PC Card: Accessing a Host Running TCP/IP

==

This article last reviewed: 5 January 1990

TOPIC ---

Is there a product for DOS that can be configured to use the Apple LocalTalk PC
Card to open a connection to a host system running TCP/IP?

DISCUSSION --

Yes. The product is NCSA Telnet for DOS. Like the version for the Macintosh,
the DOS version is available from the Supercomputer Research Center at the
University of Illinois. Judging from comments on USENET, setting up the
required configuration file is not for the faint-hearted.

For more details, search the Tech Info Library under "NCSA Telnet."
