Macintosh IIci/IIfx: How to Install AppleShare

======================================================================

This article last reviewed: 30 May 1990

TOPIC -------------------------------------------------------------

I want to convert a Macintosh IIci and Macintosh IIfx into AppleShare File
Servers.  However, I cannot get the Installer to run on these Macintosh
systems.  Can you help?

DISCUSSION --------------------------------------------------------

The AppleShare File Server Installer disk will not start up on a Macintosh IIci
or Macintosh IIfx.  The AppleShare File Server Installer disk is a System
Software 6.0 startup disk.  The Macintosh IIci will start up only from a disk
containing System Software 6.0.4 or later; the Macintosh IIfx will start up
only from a disk containing System Software 6.0.5 or later.

You need to use the Network Products Installer disk that comes with
System Software 6.0.4 and System Software 6.0.5 to install the AppleShare File
Server software.  The Network Products Installer has scripts to install the
following network software:

- AppleShare Apple II Support
- AppleShare File Server
- AppleShare Print Server
- AppleTalk Internet Router
- EtherTalk
- SMB File Transfer
- TokenTalk
