Everex Backup Problem

=====

This article last reviewed: 11 June 1990

TOPIC -----

Our file server is a Macintosh SE with 4MB RAM and two external 80MB hard drives running System Software 6.0.2. One hard drive is partitioned into two volumes. When I try to backup one of the volumes on the partitioned drive to an Everex 91/60 using Everex Backup Software, I get System Error 28. (The other volumes back up without any problems.) Can you explain this?

DISCUSSION -----

The EMAC engineer we spoke with indicated that Error 28 typically means too many files have been selected for backup. They suggest either starting up from the EMAC Utility disk for the backup or performing multiple backups with a smaller number of files. For more information, contact their tech support.
