Article Last Updated:

TOPIC -----------------------------------------------------------

Are the Coax/Twinax card and MacDFT compatible with System 7?

DISCUSSION ------------------------------------------------------

The Apple Coax/Twinax card is compatible with System 7, and the installer
for System 7 updates the A/ROSE software needed to run that card.  The
Coax/Twinax card can be used with System 7 and compatible third-party
products.

MacDFT is not compatible with System 7.  Users who require MacDFT
functionality should not upgrade to System 7 until the upgrade to MacDFT is
available.
