TOPIC ---

Do you know of any Macintosh product that handles DTMF (Dual Tone Multi
Frequency) decoding, voice mail, and audiotex?

DISCUSSION --

TFLX, from Magnum Software, is a complete audiotex system for any 1MB
Macintosh with a 20ns or faster hard disk.

TFLX is a combination hardware and software product. It connects to a
serial port, has a sound digitizer, 1200 baud Hayes-compatible modem,
serial port pass-through, and DTMF decoding. It can detect busy, ring,
modem and fast busy recognition. The package is MultiFinder and AppleShare
compatible and has a graphical user interface.

It also has database telemarketing capabilities, with keypad input for
menu-driven operations.

The entire operation of the unit is programmable using Magnum's custom
icon-oriented language.
