HyperCard: RAM Cache Launching Problems

==

Article Created: 29 April 1991

Article Last Updated: 5 June 1992

TOPIC ---

While trying to launch HyperCard 1.2.5 under System 6 with the RAM Cache ON, I
only get a menu bar that says "HyperCard". The menu doesn't really work and my
computer locks up. If I turn RAM Cache OFF, HyperCard launches just fine.

Removing all the INITs from the System Folder doesn't help.

DISCUSSION --

There is no known problem using the RAM Cache with HyperCard, so your problem
is probably a corrupted HyperCard file. Try these steps:

1) Rebuild the desktop.

2) Use a new Home card.

3) If you're still having problems, replace your HyperCard application.
