System 6.x: Ways to Change System Memory Configuration (1/95)

======================================================================

Article Created: 29 April 1991
Article Reviewed/Updated: 12 January 1995

TOPIC -----------------------------------------------------------

I have a Macintosh IIci with 4 MB of RAM that is crashing frequently when using
Microsoft Excel 2.2. I called Microsoft and they told me I needed to increase
the size of my System file's memory partition under MultiFinder. How do I do
this??

DISCUSSION ------------------------------------------------------

There's only one of two memory allocation changes that Microsoft could be
referring to:

  1) The memory allocation for Excel

  2) The memory allocation for Finder

We suggest that you try these options by using the Get Info dialog in the
Finder. If neither of the above options work, you should perform a clean system
install.

Article Change History:
12 Jan 1995 - Revised article, removed discontinued third-party option.
