TOPIC -------------------------------------------------------------

Plottergeist is a Macintosh Chooser-level plotter driver that supports
Hewlett-Packard and Houston Instrument plotters.

DISCUSSION --------------------------------------------------------

Plottergeist allows the connection of a Macintosh to plotters to produce
plotted output from CAD software, presentation packages, drawing and graphics
programs. Compatible with all Macintosh applications, the plotter can be chosen
from within a software application.

Background printing allows users to work on the Macintosh while their document
is being plotted. A preview mode allows users to see their entire document
before sending it to be plotted.

Arbitrary reduction and enlargement allows scaling output to fit from a
standard letter-size page to a 36 by 48-inch E-size drawing. You can print
smooth text in large sizes, or use the plotter's built-in fonts for fast draft
work.

The package includes disk, manual and an RS-232 interface cable.

Plottergeist requires a Macintosh Plus or later.  Background printing requires
2MB of RAM and MultiFinder.

Plottergeist is available from Palomar Software, Inc.  For more information,
search on the keyword, "Palomar".
