TOPIC ---

Compatibility Checker 1.0 doesn't run properly on a hard drive that has
only numeric characters as the volume name.

DISCUSSION --

This is a known problem. This is a HyperCard limitation and cannot be
fixed through Compatibility Checker itself. The program thinks that the
numeric string, used as a hard-drive name, is a HyperCard button ID rather
than a volume name.

The workaround is to rename the hard drive with a non-numeric name before
running the Compatibility Checker.
