Article Last Updated:

TOPIC -----------------------------------------------------------

How do I put System 6.0.7 on the PATHWORKS install disk?

DISCUSSION ------------------------------------------------------

The PATHWORKS for Macintosh Installer Disk is just like a normal System
Software 6.0.7 bootable diskette.  The disk has AppleShare Workstation
software so you can have access to a VAXshare file server.  All the
PATHWORKS for Macintosh programs are located a the VAXshare file server.
The PATHWORKS Installer Disk will work if your Macintosh is connected to
the Digital network through LocalTalk and a router, or through an Apple
EtherTalk NB card (EtherTalk software must be installed on this Installer
Disk for this use).
