TOPIC -----------------------------------------------------------

I have a serial cable that was specifically designed to connect my Apple
LaserWriter IINTX to a DOS machine.

What are the switch settings on the LaserWriter that will allow my Compaq
computer to transmit data serially and have PostScript access?

I want to transmit at least 9600 Baud, but not greater than 19,200 Baud.

DISCUSSION ------------------------------------------------------

Here are your LaserWriter switch settings:

For 9600, XON/XOFF handshake and PostScript:

Off  On  Off  Off  Off  Off

For 9600, XON/XOff handshake and text (screen dumps, text only Applications):

Off  On  On  Off  Off Off
