Apple Iie Card: Effect of Video RAM in Macintosh LC

=====  
Article Created: 13 August 1991  
Article Last Reviewed: 23 July 1992  
Article Last Updated:

TOPIC -----

What effect does the Macintosh LC's video RAM card have when running Apple Iie programs using the Apple Iie card with a color monitor?

DISCUSSION -----

The 13-inch High Resolution RGB monitor works fine on the Macintosh LC in Apple Iie emulation. The video RAM SIMM has no effect on Apple Iie emulation. The VRAM SIMM increases the pixel depth of the monitors so it displays more colors or shades of grey.
