PowerBook 170: Display Dimming is Normal

=====
Article Created: 21 October 1991
Article Reviewed/Updated: 3 August 1992

TOPIC -----

Sometimes I can see the display of my PowerBook 170 getting dimmer. Is this normal?

DISCUSSION -----

Yes. This is a normal condition of the active matrix as the voltage level of the battery decreases.

Here are three levels of brightness to expect:

- With the adapter plugged in, the display is at its brightest.
- Without the adapter plugged in, the brightness drops by about 30%.
- Without the adapter, the display dims automatically at the first dialog box to about half the brightness of the display when the adapter is plugged in.
