TOPIC ---

What is the difference between the LaserWriter IIf and IIg?

DISCUSSION --

Both are based on the same design, but there are four major differences:

- The IIg has 5MB of RAM, which is the minimum required for PhotoGrade
  printing. The IIf can support PhotoGrade with the addition of a 4MB RAM
  Upgrade kit.

- Ethernet is built into the IIg. It is not available on the IIf.

- The processor on the IIg runs at 25Mhz compared to 20Mhz for the IIf.

- The IIf is less expensive.
