### TOPIC -----

Printing time is slower when I print from a Macintosh Plus to a Personal LaserWriter LS than it is when I print from a Macintosh Classic II or Macintosh IIfx to the same Personal LaserWriter LS.

### DISCUSSION -----

Because the speed of the Macintosh computer's CPU affects the printing time, printing from a Macintosh Plus to the Personal LaserWriter LS is slower than from a higher-speed computer, like the Macintosh Classic II or Macintosh IIfx.

The Personal LaserWriter LS has a high-speed RS-422 serial interface, externally clocked at 909KB/sec. At optimum performance, it prints four pages per minute.
