A/UX 3.0: Booting to a Known Good Kernel

=====  
Article Created: 23 March 1992

### TOPIC -----

Using A/UX 3.0, when I run newconfig or autoconfig, the kernel becomes unusable, and I have to reinstall. On other UNIX platforms, it's relatively painless to boot to a known good kernel, and then reconfigure the kernel. Is this possible on the Macintosh?

### DISCUSSION -----

The 3.0 newconfig is essentially the same as 2.0. The way to boot to a known good kernel is to "launch /newunix" from A/UX Startup. Then try /etc/newconfig.
