Performa 405: Memory Upgrade Information (3/94)

=====================================================================

Article Created: 21 July 1993
Article Reviewed/Updated: 15 March 1994

TOPIC -------------------------------------------------------

I want to upgrade the memory of my Performa 405 from four to 10MB. Would
I add a card rather than replace the existing one?  What is the generic
name of the card I should look for?

DISCUSSION --------------------------------------------------

Memory upgrades for the Performa 405 are accomplished with SIMMs rather
than a memory card.

To perform a 10 MB upgrade, you need two 4MB SIMMs rated at 80ns or better
(70, or 60ns).

The only cards you'd use with your Performa to improve performance would be
a third-party accelerator card, which could improve the speed of most of
your applications, but not increase your memory capacity.
