Duo: If Processor Cycling Slows Applications (8/93)

==

Article Created: 9 August 1993

TOPIC ---

Why do some of my application run extremely slow on my Duo, but not on my
desktop Macintosh?

DISCUSSION ---

The Duo has several settings for battery conservation that ration power to
different areas of the computer.

The Duo is set to reduce the power supply to the microprocessor when the
computer is inactive for a few seconds. Most applications will not be affected
significantly by this feature, but if you find certain applications perform
unacceptably slowly, turn Processor Cycling off:

1) Choose Control Panels from the Apple menu.

2) Click the Options menu.

3) Click "Don't allow cycling."
