HyperCard 2.0: Sliding Objects in HyperCard Reports (7/92)

Article Created: 7 March 1991

Article Reviewed/Updated: 23 July 1992

TOPIC -----

While HyperCard 2.0 doesn't have any native ability to slide report items up or left if one is blank while printing reports, it is possible to get that accomplished.

DISCUSSION -----

The trick is to use a single report item, instead of one for each field. Then, by double-clicking on the report item, you can set the contents of the item to a call to a function. The function can be in your stack or background scripts, and can process the information on the card.

For example:

Assume the following fields: Name, Company, Address1, Address2, City, State, and Zip. Now assume that Company and Address2 will sometimes be empty, and that they should slide.

For the contents of your one report item in your label template, simply enter the name of a function: makeLabel()

Now, in your stack script write something like the following handler:

function makeLabel

put bg field "Name" into theLabel
 if bg field "Company" is not empty
 then put return & bg field "Company" after theLabel
 put return & bg field "Address1" after theLabel
 if bg field "Address2" is not empty
 then put return & bg field "Address2" after theLabel
 put return & bg field "City" & ", "& bg field "State" & " " & bg field "Zip"
 after theLabel

..TIL14591-HyperCard_2-0-Sliding_Objects_in_HyperCard_Reports_7-92_(TA31118).pdf

return theLabel
end makeLabel

For each card that's printed in the report, the single report item will be evaluated according to the function above, and will print the formatted label.
