Newton MessagePad: Preventing Early Alarms For Events (4/94)

=====================================================================

Article Created: 18 April 1994

TOPIC -----------------------------------------------------------

This article describes a workaround that prevents alarms for repeating events in
the Newton Datebook from going off early.

DISCUSSION ------------------------------------------------------

Sometimes Datebook alarms go off days, weeks, or months early. But, if events
are created in a specific order, then the alarm for these events is not
activated prematurely.

When creating the repeating event, create the item in the following order:

1) Create the meeting or day note
2) In the event slip, set the Alarm
3) Set the Frequency

Make sure you set the Alarm before you set the Frequency. If you set the
frequency first, the alarm for the event may go off early.
