Power Macintosh: Select Flicker Free Format (5/94)

==

Article Created: 24 May 1994

TOPIC ---

On a Power Macintosh AV system using NTSC/PAL output to a television, the
Flicker Free option is disabled in the Monitors Control Panel. Why?

DISCUSSION --

When using NTSC/PAL video output, you must be in 256 colors before you can use
the Flicker Free option. Setting the output to "Thousands" or "Millions" of
colors uses too much video RAM and will disable this option until more memory is
available.

If your are digitizing movies or pictures, it is best to connect a computer
monitor to the Power Macintosh's AV card, set the resolution to 640x480, and set
the colors to "millions". This will produce the best results for digitizing.
Use the NTSC/PAL output options for presentations or for recording.
