A/UX: UUCP under A/UX 3.0 (9/94)

===

Article Created: 14 September 1994

TOPIC ---

What is different about UUCP under A/UX 3.0?

DISCUSSION ---

UUCP under 3.0 is much improved over it's previous "incarnation" under 2.0.1.
3.0 uses HDB (for HoneyDanBer) UUCP instead of standard UUCP. Some nice things
are bidirectional getty (also known as uugetty in other Unixs) which allows both
incoming and outgoing communication over serial lines as well as better
performance and reliability.

You may consider getting Alexis Rosen's "sendmail.cf" file for use under UUCP
sendmail. This config file has been modified to allow UUCP and sendmail to work
beautifully together. You may also want to consider simply installing smail to
replace sendmail.

Under 3.0, be sure that you are running the latest version: 1.16. It can be
found on aux.support.apple.com in aux.patches/supported/3.0. Be sure that you
get the new dial.o on ftp.apple.com (pub/earlw/dial) to avoid breaking syslog.
Under 3.0.1 (and later) all is OK.
