AppleScript: Editor Cursor Flashes Left of Mouse Click (1/95)

=====
Article Created: 17 November 1994
Article Reviewed/Updated: 12 January 1995

TOPIC -----

An interface problem occurs when using the Apple Script Editor under System 7.5 on a Power Macintosh.

DISCUSSION -----

When a user tries to click on the script in the script editor, the flashing cursor does not 'go' where one clicks. The cursor actually appears on a different character, usually one or two characters to the left of where the user clicked.

The immediate workaround is clicking further to the right to get the cursor where you want. Removing the WorldScript Power Adapter from the extensions folder will eliminate the problem.

Apple Engineering is aware of the problem and is working on a solution.
