LaserWriter 16/600 PS: Correct Way To Use lpr in UNIX (5/95)

===

Article Created: 1 May 1995

TOPIC ---

This article contains a correction to the LaserWriter 16/600 PS Setting Up,
Connecting, and Using Your Printer manual.

DISCUSSION --

In Chapter 4 "Setting Up the Printer for UNIX Users", on page 129 the manual
states:

12) Test printing with the following command:
.   lp -d printer_IP_name   filename

This is incorrect. In order to print properly, you need to use the following:

lp -d print_queue_name   filename

In other sections of the manual, it states to use lpr -P printer_IP_name. This
is also incorrect, you need to use lpr -P print_queue_name.

For "lpr", the "print_queue_name" is the entry name in the "printcap" file.

For "lp", the "print_queue_name" is generated by the underlying UNIX printer
spooler facility.
