Power Macintosh 9500/120: Portrait Monochrome Display (12/95)

Article Created: 19 July 1995
Article Reviewed/Updated: 12 December 1995

TOPIC -----

Does the video card that comes pre-installed in the Power Macintosh 9500/120 support the Apple Portrait Display? If so, does the card support 256 shades of gray?

DISCUSSION -----

The Apple portrait display (Monochrome 15-in. display) is supported by the Power Macintosh 9500/120 Apple Accelerated Graphics Card (ATI). The Technical Specification booklet which came with the computer lists the Portrait Display incorrectly as an RGB monitor. The color depth is also incorrect for both memory configurations.

The proper listing should be:

Monitor	Resolution	Max Colors 2 MB	Max Colors 4 MB
-----	-----	-----	-----
15-in Portrait monochrome	640x870	8bpp (256 shades)	8bpp (256 shades)

Article Change History:
12 Dec 1995 - Corrected type of display in topic area.
