AppleVision Software: Not Supported With Non-AV Monitors (9/95)

=====
Article Created: 22 September 1995

TOPIC -----

I recently installed the AppleVision software on my Macintosh. I wanted to get a version of the Control Strip that works on my Macintosh and take advantage of the Monitor BitDepth and Monitor Resolution Control Strip modules included with the AppleVision software. Although I do not have an AppleVision Monitor, the AppleVision software and Control Strip functions worked fine on my computer initially. However, when I restarted the computer recently, it froze when the "Display Enabler" extension appeared on the screen.

DISCUSSION -----

The AppleVision software is only intended for use with Macintosh and Power Macintosh computers that have an AppleVision or AudioVision Display connected. Even though it may work, the AppleVision software checks for display type through the ADB bus and therefore is not supported on Macintosh and Power Macintosh computers that have other displays.
