ColorSync: Profile Keeps Resetting to 13" RGB (11/95)

=====

Article Created: 20 November 1995

TOPIC -----

The System Profile in my ColorSync System Profile control panel keeps reverting back to Apple 13" RGB Standard. I cannot find a preference file to trash. Where is this information saved and how do I solve this issue?

DISCUSSION -----

The System Profile selection is stored in the ColorSync extension itself. Drag the ColorSync extension to the Trash and re-install it from your backup system software or display software installer. You will have to reselect your display type in the ColorSync System Profile control panel but it will now save your setting.
