AICK: Config PPP Does Not Have Enough Script Lines (1/96)

===

Article Created: 11 January 1996

TOPIC ---

I am trying to get my Config PPP control panel connect script to work with the
Chameleon server software my local service provider (ISP) running. I do not seem
to have enough script lines available for the logon script. I was given 9 lines
but my Config PPP only has 8 lines.

DISCUSSION --

The Apple Internet Connection Kit (AICK) dialer (Apple Internet Dialer) is an
alternate user interface for configuring MacPPP, MacTCP, Open Transport's TCP/IP
control panel, and some parameters in Internet Config. Configure your internet
parameters in one place, rather than four.

MacPPP 2.1.4 (included with AICK) and FreePPP 1.0 are both derived from an
earlier version of MacPPP - MacPPP 2.1.2SD. The documentation included with
FreePPP and in particular the file Installing MacPPP provides the extra details
you may need to configure AICK to work with your ISP.

You can put more than one command per line in both MacPPP and the AICK dialer,
thereby working around the 8 line limit in many cases. With this information you
and your provider should be able to come up with a script that works. Fax or
email your ISP the Installing MacPPP document and then ask them to save the
"recipe" you discover.
