TOPIC ---

This article provides a brief description of the Disk Management Utility and
CommandShell that run on a remote Macintosh computer.

DISCUSSION --

In addition to AIX 4.1.4, the software used to run the Network Server also
includes the Disk Management Utility and CommandShell, which were created by
Apple for use with AIX on the Network Server. These applications run on a
remotely connected Macintosh computer. They connect to AIX daemon processes to
allow you to perform system administration tasks.

• The Disk Management Utility
This application allows you to manage all aspects of disk storage. It uses a
graphical user interface that offers various views of the disk storage structure
as well as methods of adding to, deleting from, and modifying the disk storage
structure. For more information, see Chapter 8, "Managing File Storage With the
Disk Management Utility" in the "Using AIX, AppleTalk Services, and MacOS
Utilities on the Apple Network Server" manual.

• CommandShell
This application is a terminal emulator that runs multiple windows on your
screen so that you can run different AIX applications or processes
simultaneously. For more information, see Chapter 9, "Remote Access With
CommandShell" in the "Using AIX, AppleTalk Services, and MacOS Utilities on the
Apple Network Server" manual.
