Power Macintosh: Audio CDs & 7.5.3 on PCI-based Systems (3/96)

=====
Article Created: 21 March 1996
Article Reviewed/Updated: 26 March 1996

TOPIC -----

What changes were made in System 7.5.3 in the way Audio CD ROM discs are used on PCI-based Power Macintosh computers?

DISCUSSION -----

With the advent of System 7.5 Update 2.0 and System 7.5.3, the "Internal CD" and "Playthrough" options no longer need to be selected in the Sound or Monitors & Sound control panel in order to playthrough an Audio CD to internal or external speakers.

An Audio CD will playthrough no matter which selections are made in the control panels, except for mute and volume changes. The change was made for PCI-based Power Macintosh computers only. However, future versions of the Mac OS may implement the change for other Macintosh computers as well.
