MAE: Zero Key on Sun Type 5 Keyboard Does Not Work (5/96)

=======================================================================

Article Created: 30 May 1996

TOPIC -----------------------------------------------------------

When running MAE and using a Sun Type 5 keyboard, the Zero key (0) on the keypad
does not work.

DISCUSSION -----------------------------------------------------------

Although the README for Patch 2.0 notes this as being fixed, the fix was never
incorporated in the release. However, engineering has posted a release on
http:// www.mae.apple.com or ftp.support.apple.com to correct this.

Locate the following directory:

/pub/mae/patches/mae_2.0_updates/sun_key_0

This directory contains keymap definitions for MAE v2.0 or 2.0.1 when using a
Sun Type 5 keyboard. Specifically, the zero (0) key on the keypad will now
function properly.

To install and use these files, perform the following steps:

Step 1
------
FTP all files in the directory `patches/mae_2.0_updates/sun_key_0' to your local
workstation.

Step 2
------
Place the files (except for the README) into the directory:

lib/KeymapDepot/sun

This directory is located within the Apple directory in which you originally
```

installed MAE. Note that this action replaces the following files within the
`sun` subdirectory:

sun.default
sun.type5.PC.US
sun.type5.UK
sun.type5.US
sun.type5.french
sun.type5.german
sun.type5.japanese

Step 3

If you already had MAE active when you performed Steps 1 and 2, open the MAE
Keyboard Control Panel and select any file that is different from the one you
currently have selected. Then reselect your desired file. This action reloads
the keymap file with the new version. Alternatively, you can also perform the
Restart command from the Special menu in the MAE Finder.

Step 4

If you did not have MAE active when you replaced the files, no other actions are
necessary. The new keymaps will be utilized when you start MAE.
