Newton Internet Enabler: Requires Modem Connection (8/96)

=====================================================================

Article Created: 15 August 1996

TOPIC -------------------------------------------------------------

I want to connect my Apple MessagePad 130 to an AppleTalk network, so I can use
the Internet. Is this possible?

DISCUSSION --------------------------------------------------------------

The current version of Newton Internet Enabler (NIE) does not support TCP/IP
over an AppleTalk network. You must use NIE in conjunction with an Internet
Service Provider (ISP) to actually connect and use the Internet.

The software required after connecting to an ISP is dependent upon what Internet
services you want to access.  To browse the World Wide Web, a WEB browser such
as NetHopper is required.  Other services such as network mail offer more
software choices such as  GoFetch, Eudora for Newton, Mail on the Run!,
LunaMail, EnRoute.

No additional information on when TCP/IP over AppleTalk will be enabled in the
Newton Operating System is currently available.

Note:
The Newton Internet Enabler works with any Apple MessagePad 120 or Apple
MessagePad 130 with at least 2Mb of RAM and the Newton 2.0 OS.
