Network Assistant: How to Get Software Versions (10/96)

=====

Article Created: 3 October 1996

TOPIC -----

I am using the Network Assistant application which is part of the Apple Network Administrator Toolkit (ANAT), and I'm trying to get software version information about one of the workstations. When I select the Software Version menu item from the Reports menu, a window reports, "This report displays version information for software installed on (name of remote workstation)". However, the window only lists the software installed on my local computer. How do I get information about the workstation that I selected?

DISCUSSION -----

In this window, is a Get Report button. Click on one of the software items in the list then click Get Report, and the version information from the remote workstation will be returned. The main window will only list software located on the local computer.
