Open Transport AppleTalk: Needs Assistant Toolbox v1.3 (2/97)

=======================================================================

Article Created: 11 February 1997

TOPIC -------------------------------------------------------------

This article discusses an incompatibility between Open Transport AppleTalk and
early versions of the Assistant Toolbox turning off AppleTalk when you restart
your computer.

DISCUSSION --------------------------------------------------------

Open Transport is incompatible with all Assistant Toolbox versions prior to
version 1.3. If you are using Mac OS 7.5.x and AppleTalk is off every time you
restart your computer, check the version of Assistant Toolbox installed in your
Extensions folder. You can install Assistant Toolbox v1.3 using the System 7.5
Update 2.0 Custom Install option.

If you need help checking the version number, see the section Checking the
Assistance Toolbox Version.

If you are using Mac OS 7.6 or later, Assistant Toolbox is built into Mac OS
7.6, so you do not have to check the version. However, if you have a version of
Assistant Toolbox installed with Mac OS 7.6, throw it away.

Checking the Assistant Toolbox Version
======================================

Step 1
------
Open the System folder.

Step 2
------
Open the Extension folder.

Step 3
```

```
------
```
Click once on the Assistant Toolbox extension.

Step 4
```
------
```
Select Get Info from the File menu (CMD-I).
